

"Static Neutralization"

The "Static Neutralization" rod (the vertical RED bar located at the nozzle discharge point) neutralizes the effects of static electricity by bombarding the air entering through the nozzles with ions, just as an ionic hair dryer eliminates static electricity when blow drying your hair. Thus metallic flow-out is consistent between both plastic and metal panels. This eliminates any necessity for grounding the vehicle.

Important...unlike plastic nozzles which increase static electricity as air passes through them..."QADS" is supplied with aluminum nozzles, designed to reduce static electricity.

What About Dirt?

The #1 question always asked...will "QADS" cause more dirt problems in my paint? The answer is.... How is your paint work now? If it's clean, it will continue to be clean. If it's not, "QADS" may, in fact, help. Just ask some of our users.

Spray Booths we have converted with "QADS"

AFC	AccuDraft
Blowtherm	Future Cure
Omka	SprayBake
Sunkiss	WelBuilt
